

ABSTRACT OF THE DISCLOSURE

In order to maintain the required security, an interface specific code is stored in an encrypted manner in a code memory which is integrated in a communication processor. In the event of an error in the communication processor, the original code is not transmitted but, if necessary, the encrypted code is transmitted. Only an external decoder is necessary to decode the code. The decoder ensures the necessary physical separation of the components in the initialisation of the code which is to be transferred.
